

**Question 1:**

What is the optimal value of alpha for ridge and lasso regression? What will be the changes in the model if you choose double the value of alpha for both ridge and lasso? What will be the most important predictor variables after the change is implemented?

**Answer 1:**

Optimal value of alpha for Ridge = 0.0001

Optimal value of alpha for Lasso = 0.0001

Changes in Ridge when alpha is doubled.

**1. Accuracy**

|          |                   |
|----------|-------------------|
| Alpha    | 0.0001            |
| Train R2 | 0.99999999822542  |
| Test R2  | 0.99999998001820  |
|          |                   |
| Alpha    | 0.0002            |
| Train R2 | 0.999999992905675 |
| Test R2  | 0.999999920372149 |

**2. Top 5 Variables**

|                         |          |
|-------------------------|----------|
| Alpha                   | 0.0001   |
| Most important variable | PoolArea |
|                         |          |
| Alpha                   | 0.0002   |
| Most important variable | PoolArea |

Changes in Lasso when alpha is doubled.

### 1. Accuracy

|          |                   |
|----------|-------------------|
| Alpha    | 0.0001            |
| Train R2 | 0.999943146873117 |
| Test R2  | 0.999941615407897 |
|          |                   |
| Alpha    | 0.0002            |
| Train R2 | 0.999775100426939 |
| Test R2  | 0.999763073038845 |

### 2. Top 5 Variables

|                         |          |
|-------------------------|----------|
| Alpha                   | 0.0001   |
| Most important variable | PoolArea |
|                         |          |
| Alpha                   | 0.0002   |
| Most important variable | PoolArea |

### Question 2:

You have determined the optimal value of lambda for ridge and lasso regression during the assignment. Now, which one will you choose to apply and why?

### Answer 2:

For Ridge I will choose  $\alpha = 0.0002$  because the drop in accuracy is negligible. And the model is choosing variables that make more business sense. For e.g. MSZoning and Foundation\_Stone

For Lasso I will choose  $\alpha = 0.0002$  because the drop in accuracy is negligible. And the model is choosing variables that make more business sense. For e.g. MSZoning, Basement Finishing, Foundation Stone, Exterior Quality

### Question 3:

After building the model, you realised that the five most important predictor variables in the lasso model are not available in the incoming data. You will now have to create another model excluding the five most important predictor variables. Which are the five most important predictor variables now?

### Answer 3:

After the model change the five most important predictor variables are:

| Variable     |    |
|--------------|----|
| ScreenPorch  |    |
| ExterQual_Fa | -1 |
| MSSubClass   | -1 |
| BsmtQual_Fa  | -1 |
| ExterQual_TA | -1 |

### Question 4:

How can you make sure that a model is robust and generalisable? What are the implications of the same for the accuracy of the model and why?

### Answer 4:

To make the model robust and generalisable we have to strike balance between bias and variance. That means that the model should be simple without compromising with accuracy. In this case I will proceed with Lasso and alpha as 0.0002 because:

1. The accuracy difference between Lasso and Ridge is insignificant
2. Lasso is also choosing variables that make business sense i.e. MSZoning, Basement Finishing, Foundation Stone, Exterior Quality
